

Master of Technology in Artificial Intelligence

M.Tech. AI Course Structure

This program is intended to impart the body of skills, knowledge and practices associated with the study of advanced computation, data science and AI, which will help to create new opportunities locally as well as globally. Specifically, three main thematic topics will be covered, viz., Neural Networks, Fuzzy system, Evolutionary Computation which form the backbone of intelligent systems. The curriculum includes multidisciplinary content covering Machine Learning, Neural Networks, Big Data Analytics, Information Retrieval, Fuzzy Systems and Evolutionary Computation. We will have opportunities to undertake practical projects, applying the learning to real-life problems prevalent in the domains like business, finance, security, industry control, engineering etc.

Objectives

The objectives of this program are as follows:

- To provide the students with the knowledge of fundamental and complex topics in AI
- To develop skills in the students to analyze large complex data.
- To collaborate with AI-based national and international institutions to foster innovation, knowledge transfer and the R&D culture to meet the growing demands of the local and global markets.

Career Prospects

The program aims to produce graduates who are interested to do research and advance their career in the field of Artificial Intelligence. After the completion of the degree, graduates will be able to perform various jobs and research activities such as:

- Computational Linguist,
- AI Specialist,
- Machine Learning Engineer,
- Computer Vision Engineer
- Data Scientist
